                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to antisense compounds, compositions and methods for modulating the expression of phosphoinositide phosphatese (PTEN). The antisense compound is used to inhibit the expression of PTEN in cells or tissues, preferably human, or rodent, such as mouse or rat, liver, kidney or adipose cells or tissues. It is used to treat a disease or condition associated with PTEN, such as a metabolic disease or condition preferably diabetes, especially Type 2 diabetes, or a hyperproliferative condition. It is also used to decrease blood glucose or insulin levels in an animal, preferably a diabetic human or rodent. It is also used to inhibit expression of PEPCK in cells or tissues. It is also used to decrease insulin resistance, or increase insulin sensitivity, in an animal, preferably a diabetic human or rodent. It is used to decrease blood triglyceride or cholesterol levels in an animal, preferably a diabetic human or rodent. It is used to decrease blood triglyceride or cholesterol levels in an animal, preferably a diabetic human or rodent.
                                                                                                                                                                                                                                                                                                                          Alzheimer's disease marker; phosphatase and tensin homologue; chromosome 10; PTEN; p70 S6 kinase gene; Alzheimer's disease; diagnosis; human; antisense therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New compound, preferably an antisense oligonucleotide, that hybridizes and inhibits the expression of phosphoinositide phosphatase (PTEN), for treating diseases such as diabetes, or a hyperproliferative condition.
Alzheimer's disease marker present in base sequence of phosphatase and tensin homolog deleted on chromosome ten gene or p70 S6 kinase gene useful as probe or primer for diagnosis of Alzheimer's disease.

The invention is useful for diagnosis of Alzheimer's disease. By making the marker into a parameter, therapeutic agents for Alzheimer's disease can be screened. The invention provides a precise diagnosis of Alzheimer's disease and thus more suitable treatment can be provided to the patient.
                                                                                                                                                                                                                                        modified_base

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to antisense compounds, compositions and methods for modulating the expression of PTEN (also known as MMACI and TEP1). The compound is useful for inhibiting the expression of PTEN in cells or tissues to treat diseases associated with their expression, e.g. metabolic diseases or conditions, type 2 diabetes or hyperproliferative conditions. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The invention is useful in gene therapy. The present sequence is human PTEN DNA specific antisense
  AAZ65654 to AAZ69578 represent human biallelic markers from the presinvention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the investment of the investment of the primers for the biallelic markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human genome, biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; haplotyping; hybridisation; density hybridisation; single nucleotide polymorphism; SNP; PCR primer; amplification; single nucleotide polymorphism;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New double-stranded oligomeric compounds that modulate PTEN expression, useful for diagnosing, preventing or treating conditions associated with PTEN, e.g. metabolic diseases, type 2 diabetes or hyperproliferative
                                                                                                                                                                                                                                                                                                                           21-APR-1998;

Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the sequence actually given a sequence in the Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            treating leukaemia; solid tumors; restenosis; polycystic kidney disease; bronchiolitis; glomerulonephritis; stroke; RNA interference; short interfering RNA; siRNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA;
                                                                                                                                                      New short interfering nucleic acid, useful ediagnosis of tumors, downregulates expression

The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They CC further comprise sense and antisense regions, or alternatively are CC assembled from a sense oligonucleotide and an antisense oligonucleotide. CC specifically, the siNAs include short interfering RNA (siRNA, double-CC stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA, double-CC stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA, double-CC stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs CC sense unmodified or chemically modified, can contain contain contains and contains and can be chemically synthesised, expressed from a CC vector or enzymatically synthesised. The invention also relates to kits CC organisms (e.g., by an invoidalisma, conjugates and/or CC complexes of siRNA; and vectors that express siNA. The siNAs are used to CC complexes of siRNA; and vectors that express siNA. The siNAs are used to CC organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or CC complexes of siRNA; and solid tumours, restenses; polycystic kidney CC disease, bronchiolitis, glomerulonephritis and stroke. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification CC useful for drug screening, diagnosis, therapeutic target identification CC useful sequence represents the lower strand of a human pDGFr-corresponded siNA, which is identical to the PDGFr transcript target demonstranded siNA, which is identical to the PDGFr transcript
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

```

Cd downregulate expression of the human platelet derived growth factor comprise ribonucleotides and may be double or or single stranded. They comprise sense and antisense regions, or alternatively are comprise sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA, double-complete unmodified or chemically modified, can contain complete unmodified or chemically modified, can contain complete to kits can be unmodified, and can be chemically synthesised, expressed from a complexes of in vivo delivery of siRNA; conjugates and/or complexes of siRNA; and vectors that express siNA. The siNAs are used to complexes of siRNA; and vectors that express siNA. The siNAs are used to complexes of siRNA; and vectors that express siNA. The siNAs are used to complexes of siRNA; and vectors that express siNA. The siNAs are used to complexes of siRNA; and vectors that express siNA. The siNAs are used to complexes of siRNA; and vectors that express siNA. The siNAs are used to complexes of siRNA; and vectors that express siNA. The siNAs are used for the treatment of a variety of conditions. They may be used for conditions of conditions. They may be used for conditions of the prostic kidney gene constants of and validation, genetic engineering, pharmacogenomics, studying gene constants of single nucleotide polymorphisms). The present sequence represents the upper strand of a human pDGFr-transcript constants and double-stranded siNA, which is identical to the pDGFr transcript constants and solutions. ne invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human platelet-derived growth factor receptor (PDGFr) gene by RNA interference sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to antisense oligonucleotides (ADM76030) and CC ADM76031) targeted to the human NEPHA gene (ADM76029), which encodes a CC novel brain-derived ephrin receptor (ADM76028). The NEPHA protein has CC 50.7% homology to the human EphA7 ephrin receptor and its gene is located CC on chromosome 1. Ephrin receptors are overexpressed in various cancers CC and it has been found that inhibition of NEPHA expression promotes CC apoptosis. The invention also relates to the NEPHA transcriptional CC control (promoter) region (ADM76037); recombinant vectors and host cells CC comprising the NEPHA promoter operably linked to a reporter gene; a CC method of screening for compounds which inhibit or activate transcription CC of the NEPHA gene; and pharmaceutical compositions comprising an CC cantisense oligonucleotide or a transcriptional inhibitor or activator. CC the antisense oligonucleotides and modulators of NEPHA transcription are CC useful for inducing apoptosis for the treatment and/or prevention of CC cancers in which NEPHA is overexpressed such as lung cancer, ovarian CC cancer, breast cancer, cervical cancer, grostate cancer, bladder cancer, Stomach cancer and colorectal cancer. Sequences ADM76379.

CC represent transcription factor binding sites within the transcriptional CC control region of the NEPHA gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

They use "nested PCR" on mRNA sequences unique to PSA and PSM and compared the results. PSA outer primers span portions of exon 4 and 5, yielding a 486 bp PCR product. The upstream primer (AAQ65541) starts at nucleotide 494 in PSA cDNA and the downstream primer (AAQ65542) starts at nucleotide 960. The inner primers are AAQ65543-44. The assay used PSA and PSM primers in order to determine the limit of detecton for the assay. There was a significantly higher level of detecton of tumor cells with PSM as compared to PSA. The PSM coding sequence is useful for suppressing or modulating the metastatic ability of prostate tumour cells to grow, or for eliminating them. (Updated on 25-MAR-2003 to correct PN field.)
                                                gene for a structural protein of cartilage comprising a sequence identified in Table I (Page 18-31). Table I includes 179 primer sequences (see AAQ65728-Q65906). The sequences of Table IA are given in AAQ65907-Q65938. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                 Detecting genetic pre-disposition to osteoarthritis - involving mutation in cartilage protein genes, by amplanalysis of DNA and comparison with standards.

                                                                                                                                                                                                                                                                                                                                                                                                 Prostate-specific antigen (PSA) outer primers (AAT36809-10) span portions of exons 4 and 5 of the PSA gene and yield a 486 bp fragment of PSA that enables differentiation between CDNA and possible contaminating genomic DNA. The upstream primer begins at nucleotide 494 in the PSA cDNA sequence and the downstream primer at nucleotide 960. They, and inner primers (AAT36811-12), were used for nested-PCR amplification of PSA CDNA. Results were compared with those obtd. using primers (see also AAT36813-16 and AAT36827-30) based on prostate-specific membrane (PSM) antigen cDNA (see also AAT36785) for the detection of prostatic hematogenous micrometastases and of circulation prostatic tumour cells. Detection levels were higher using PSM primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA encoding alternatively spliced prostate-specific membrane antigen - useful to develop prods. for detecting haematogenous micrometastic tumour cells, or prostate cancer progression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a primer for prostate specific antigen (PSA) DN The primer was used in the development of a novel method for the detection of cancer cells, conjusting the detection of prostate tumour inducing gene, PCI-1, expression. The method can be used to detect carcinoma cells or prostate, breast, colon or lung cancer cells, and determine whether a subject has metastatic or late stage prostate cance

It was used to isolate CAG repeat containing sequences from the human genome to test the method of the invention. The method is for analysing nucleic acids in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the nucleotide sequence of a PCR primer used for amplification in the method of the invention involving the human p33-ING1 protein. The CC ING1 gene encodes p33-ING1 which can be used to modulate the activity of, CC isolate or detect p53. Expression of the ING1 and p53 genes in a CC mammalian cell results in normal growth regulation anchorage-dependent CC growth and apoptosis as a response to irreversible DNA damage and other CC cellular insult. Inhibition of expression of either gene results in a CC loss of cellular growth control, anchorage independent growth, inhibition CC of apoptosis and resistance to radiation and cytotoxic drugs. The p33-CC ING1 is a component of the p53 signalling pathway that cooperates with CC p53 in negative regulation of cell proliferation by modulating p53 CC dependent transcriptional activation. Biological function of p53 CC suppressed) by modulating p33-ING1 activity. The modulation of p33-ING1 activity can be used for the stimulation or restoration of the p53 cpathway in anti cancer therapy or for the suppression of the p53 pathway to defend sensitive tissues from genotoxic stress or for the generation constant cell lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR primers AAZ36085-Z36086 are used to amplify the mouse MCAD gene. The primers and the PCR product are used in the method of the invention which relates to a novel quantitative reverse transcriptase polymerase chain reaction (RT-PCR) assay for quantitative gene expression. The method is used for determining a quantitative measure of the expression of a gene of interest in a biological sample by determining a normalised RNA prevalent for the gene of interest. The invention also relates to a method for determining the effect of a treatment on a quantitative measure of the expression of a gene of interest, or of a panel of genes of interest, in a sample by determining a normalised RNA equivalent for the gene of interest, in a first untreated sample and a second treated sample. The methods are used for quantitative gene expression, where determination of changes in gene expression provides a measure of the biological response to a treatment or drug. The method have uses in
                                                                                                                                                                                                                                     Detecting presence of disseminated cell marker in a sample for diagnosing metastatic cancer, involves eliminating illegitimate transcription-positive cells from sample and detecting presence of mana encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymerase chain reaction; PCR; primer; amplify; detection; disseminated; cell marker; epithelial; metastatic cancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Сарв
```

The sequences given in AAI71359-83 are primers which were used in the method of the invention for detecting the presence of a disseminated cell marker in a sample. The method comprises eliminating illegitimate transcription-positive cells from the sample, and detecting the presence of mRNA that encodes the marker. The expression of epithelial cell markers in blood cells was examined by RT-PCR using these transcriptespecific primers. The method is useful for detecting the presence of a

cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                 The invention relates to sialic acid binding immunoglobulin-like lectin (Siglec)-like gene (SLG) polypeptides and polynucleotides. SLG polynucleotides can be used to modulate the activity of the SLG protein in antisense therapy. The SLG protein conditions that can be treated are cancer and haematopoietic disorders such as aplastic anaemia, leukaemia and lymphoma especially myelogenous and chronic myelogenous leukaemia. The SLG protein or a peptide can be used in a vaccine to treat cancer. They are also used in drug discovery. The present sequence is reverse transcription PCR (RT-PCR) primer used in cloning and molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     disseminated cell marker in a sample, and for diagnosing metastatic cancer by detecting the presence of a disseminated cell marker for cells identified as from the primary cancer in a sample that does no normally express the marker
                                                                                                                                                                  Sequence

                      The invention relates to a compound that is 8 - 50 nucleobases in length targeted to a nucleic acid molecule encoding Casein kinase 2-beta, and which specifically hybridises with and inhibits the expression of Casein kinase 2-beta, or which specifically hybridises with an 8-nucleobase portion of an active site on a nucleic acid molecule encoding Casein kinase 2-beta. Also included are: (1) a composition comprising the compound, and a carrier or diluent; (2) inhibiting the expression of Casein kinase 2-beta in cells or tissues by contacting the cells or tissues with the compound so that the expression of Casein kinase 2-beta is inhibited, and (3) treating an animal having a disease or condition associated with Casein kinase 2-beta by administering to the animal the new compounds so that the expression of Casein kinase 2-beta is inhibited. The antisense compounds are useful for modulating the expression of Casein kinase 2-beta and for treating diseases or conditions associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotides targeted to nucleic acid encoding kinase 2-beta, useful in diagnostic and research applications, or treating a disease or condition associated with the expression of kinase 2-beta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Key

                                                                                                                                             Query Match
                                                                                                                                                                                                                                         The invention relates to an isolated polypeptide designated prostating specific membrane (PSM) antigen. The PSM antigen is useful in diagning preventing or treating prostate cancer in a patient or in isolating homologous gene or genes in different mammals. The present sequence represents human prostate specific antigen PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hyperproliferative disorders, particularly cancer, such as breast can prostate cancer, or liver cancer. The antisense compounds are also us for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of biological pathway. The present sequence is an antisense oligonucleous of the invention targeting human casein kinase 2-beta
                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated polypeptide designated as prostate-specific membrane antigen, useful for diagnosing, preventing or treating prostate co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             24-FEB-1995;

The yeast of the invention may be used for producing food and drink with enriched gamma-glutamyl cysteine or cysteine which is

junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a respiratory, lung or malignant disease or condition, also or reventing a respiratory, lung or malignant disease or condition, also of or enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC or enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of bulquinone or CC lung surfactant in a subject's tissue, or treating bronchoconstriction, lung sulfamation, lung allergies, or a respiratory disease or condition. CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targe nucleic acids associated with lung airway or lung dysfunction bronchodilating agent. f adenosine, targeted to lung dysfunction, and

Claim 15; SEQ ID NO 2467; 763pp; English

CC comprising oligonucleotides, effective for alleviating composition of igonucleotides, effective for alleviating composition, respiratory tract inflammation, allergies and correducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, consider that or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating context or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery consistency, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antialergic, antiinflammatory, antiasthmatic, consistency, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production cor availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or burnfactant hypoproduction are associated with a disease or condition such as pulmonary vascomstriction, and or such as pulmonary vascomstriction, confirmed adenosine content of the anti-sense oligon creases, pulmonary disease, pulmonary disease, pulmonary continues present in the target RNA or to receive pulmonary disease, pulmonary continues and content of the anti-sense oligon corresponding to the oligonucleotides into products that free adenosine into the system of the oligonucleotides into products that free adenosine into the system of the oligonucleotides into afforts that free adenosine into the system of the content of the arti-sense oligon corresponding to the oligonucleotides into afforts the first die to it. This invention describes a novel composition comprising oligonucleotides, effective for al any unwanted effects due to (a) a first active agent,

                                                                                                                                        The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CP), chronic obstructive pulmonary diseases (CODD), allergic rhintis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway the process of the content of the conten
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          interleukin; IL-4 receptor; IL-5 receptor; lung disease; airway inflammation; allergy; asthma; impeded respiration; cystic fibrosis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; oligonucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes e.g., CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nyce JW,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel isolated polypeptide having the biological activity of an alternatively spliced prostate-specific membrane (PSM) antigen. The invention is useful for making prostate cells susceptible to a cytotoxic chemotherapeutic agent which involves contacting prostate cells with the polypeptide of the invention in an amount effective to render the prostate cells susceptible to the agent. In addition, the invention is useful for identifying ligands that bind PSM which are useful for imaging prostate cancer in human patients. The present sequence is that of a PCR primer which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 20 BP; 7 A; 7 C; 3 G; 3 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated polypeptide having biological activity of alternatively spliced prostate-specific membrane antigen, useful for identifying ligands useful in imaging prostate cancer in human patient's.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                24-FEB-1995;

                                                                                                                                                                                                                                                      망
                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel compound 8-80 nucleobases in length which is targeted to and specifically hybridises with a nucleic acid molecule encoding PTPRA (protein tyrosine phosphatase, receptor type alpha, LCA-related phosphatase; LRP; HLPR; HPTPA; PTPRL2; RPTPA) and inhibits the expression of PTPRA. The compound of the invention demonstrates cytostatic activities and may be useful for treating a disease or condition associated with PTPRA, such as a hyperproliferative disorder or metabolic disorder, as well as in research and diagnostics for modulating the expression of PTPRA. The current sequence is that of an antisense 2'-MOE (2'-methoxyethyl) gapmer oligonucleotide which was
             PTPRA; protein tyrosine phosphatase, receptor type alpha; LCA-related phosphatase; LRP; HLPR; HPTPA; PTPRL2; RPTPA; cytostatic; hyperproliferative disorder; metabolic; antisense target; human; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New compounds, particularly antisense oligonucleotides targeted to nucleic acid encoding protein tyrosine phosphatase receptor type al (PTPRA), useful for treating hyperproliferative or metabolic disord
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PTPRA; protein tyrosine phosphatase, receptor type alpha; PTPRA; protein tyrosine phosphatase; LRP; HLPR; HPTPA; PTPRL2; RPTPA, cytostatic; hyperproliferative disorder; metabolic; antisense; ss; human; 2'-mOE wing; 2'-methoxyethyl gapmer; phosphorothioate backbone.
                                                                             Human PTPRA
                                                                                                            06-MAY-2004
                                                                                                                                           ADK43347;
                                                                                                                                                                         ADK43347 standard; DNA; 20
                                                                                                                                                                                                                                                                                                                                                                                Sequence 20 BP; 2 A; 9 C; 1 G; 8 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                              targeted to human PTPRA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 15; SEQ ID NO 48; 289pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2004-143851/14.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel compound 8-80 nucleobases in length which is targeted to and specifically hybridises with a nucleic acid molecule encoding PTPRA (protein tyrosine phosphatase, receptor type alpha, LCA-related phosphatase; LRP; HLPR; HPTPA; PTPRL2; RPTPA) and inhibits the expression of PTPRA. The compound of the invention demonstrates cytostatic activities and may be useful for treating a disease or condition associated with PTPRA, such as a hyperproliferative disorder or metabolic disorder, as well as in research and diagnostics for modulating the expression of PTPRA. The current sequence is that of a human PTPRA DNA of the invention which was targeted for antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, and exendransplant rejection or mechanical organ replacement rejection, in a individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arrhritis, lupus, inflammatory bowel diseases, multiple sclerosis, HTV/AIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to novel methods for administration of protein therapeutic molecules so as to avoid inactivation through use of VHH antibodies derived from Camelidae antibodies. The invention may be useful for the production of compounds with antiinflammatory, cytostatic, gastrointestinal-Gen, antitubercular, tuberculostatic, virucide, antiallergic or immunosuppressive activity or for gene therapy. The polypeptide construct and method are useful for treating, preventing and/or alleviating disorders such as inflammation, colon, head, neck or lung cancer, indigestion, gastritis, tuberculosis, flu, allergies, transplant rejection or autoimmune disorder. These may also be used in preparing a medicament for treating, preventing and/or alleviating the above disorders. The present sequence is that of a PCR primer which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New VHH

This probe was one of two (see also AAQ20341) designed based on the N-terminal sequence and was used in a Southern hybridisation of the PS3372 plasmid and total cellular DNA. A region of a positive band was amplified and used as a probe to clone the PS33F2 toxin gene. See also AAQ20336 and AAQ20343. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Toxin pr
PS33F2,
                                                                                                                   The present invention relates to toxins from Bacillus thuringiensis (see AAF23793-AAF23797 and AAB59881-AAB59885). The toxins have activity against hymenopteran pests e.g. carpenter, fire, argentine and pharaoh ants. The toxins can therefore be used to produce formicidal compositions for controlling ants, which are a better alternative to chemical insectides. The present sequence is a probe used to identify the toxins

Gene sequences encoding a toxin which is active against acarides and is obtainable from B. thuringiensis isolates PS17a, PS17b, 33f2, PS52A1, PS69D1, PS86A1 and PS50C are given in AAQ30803-07 and AAQ30820-21 respectively. The toxin is a delta-endotoxin active against acarid pests, including the Two Spotted Spider mite. The isolates can be used against non-phytophagus mites such as acarid pests of livestock, fowl and stored prods. The genes can be cloned and used to transform other hosts, which can be used to control mites, or in the case of transgenic plants, be resistant to mites. See AAQ30805 and AAQ37091-92.   Sequence
                                                 The present sequence is a primer for the PCR amplification of the Bacillus thuringiensis isolate PS63B delta-endotoxin DNA. (Update MAR-2003 to correct PF field.)
                                                                                                                                                                                                Host expressing Bacillus thuringiensis toxin active against ants - for control of domestic and agricultural pests.
                                                                                                                                                                                                                                                                                                                           Payne JM, I
Schnepf HB,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RFLP analysis was performed on DNA of Bacillus thuringiensis strain PS33F2 using probes (given in AAQ81163-64) based on the N-terminal peptide (AAR63074) of the 33F2 toxin. Probe 33F2A (AAQ81163) and a reverse PCR primer (AAQ81165) were then used to amplify an approx. 1.8 DNA for use as a hybridization probe for cloning the 33F2 toxin gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-APR-1997.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            amplification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bacillus thuringiensis isolate PS63B delta-endotoxin DNA primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAT66806;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 21 BP; 7 A; 2 C; 3 G; 6 T; 0 U; 3 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                CC AAT60046-T60058 represent probes for the ant-active genes of the CC invention. These sequences were used to screen the genomes of Bacillus CC thuringiensis (B.t.) isolates to identify the coding sequences for the CC toxins of the invention. The probes can also be used as PCR primers to CC amplify the identified sequences. One of the coding sequences identified CC by these probes is represented by AAT60045, and encodes the 86Q3a toxin CC inclusions. These PS86Q3 (NRRL B-18765). B.t. is a gram-positive, spore CC inclusions. These proteins can be highly toxic to pests, and have been CC used to produce insect resistant plants. The previously isolated B.t. CC delta-endotoxins were mainly active against lepidopteran insects, however the proteins of the invention are active against hymenopteran insects. CC The proteins encoded by the identified sequences are examples of the CC toxin of the invention, for which the sequences shown in AAW13888 and CC AAW13871 represent the generic formulae. As the toxins of the invention care active against hymenopteran pests, they can be used for the Diological control of ants, particularly pharaoh ants (Monomorium CC pharaonis). (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence is a probe for DNA encoding a Bacillus thuringiensis (B.t.) toxin of the invention. The toxins are lethal to a hymenopteran pest. The polynucleotides are useful for the recombinant production of B.t. toxins. These toxins in turn are useful as pesticides against hymenopteran (ant) pests, especially fire, carpenter, argentine and pharaoh ants. The toxins are parasporal crystalline protein inclusions that are highly specific toxins to pests. The toxins are highly specific against ants, rather than e.g. toxic chemicals used as insecticides which can be harmful to humans and the confirmance of the confirm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       B.t. toxin; hymenopteran pest; pesticide; ant; insecticide; parasporal crystalline protein inclusion; probe; ss.

The information obtained from nucleic acid analysis by the method described is useful in diagnosis or monitoring of diseases like cancer, inflammation, heart disease, CNS diseases, and susceptibility to infection by microorganisms. In addition, the nucleic acid segments are useful in manufacturing medication in the treatment of prophylaxis of diseases, and also the use of the DNA segments as pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid segments containing polymorphic sites, and methods of detecting a nucleic acid - for general u diagnosis and monitoring of diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          07-MAR-1997;

                                                                                                            The present invention relates to novel Bacillus thuringiensis toxins with hymenopteran activity. Preparations containing protein from Bacillus thuringiensis were tested for toxicity to ants. The N-terminal amino acids of toxic proteins were then sequenced. These sequences were used to design oligonucleotide probes. The probes were used to clone ant-active toxin genes. The present sequence is a probe that may be used for rapid identification of Bacillus thuringiensis ant-active genes. The toxic proteins can be used to control pests such as fire ants, carpenter ants, argentine ants and pharaoh ants. The proteins can also be used for producing transgenic plants that are resistant to attack by ants. The proteins are a safe and effective biological control agent against ant
                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                               New Bacillus thuringiensis toxins with activity against hymenopteran pests such as fire ants and carpenter ants, conform to a specific ger formula and have a specific amino acid sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to an isolated human erg2 potassium channel subunit protein. The erg2 protein of the invention is useful for identifying activators or inhibitors of potassium channels containing the protein. The erg2 protein is also useful in counter screens for assays designed to identify activators and inhibitors of other drug targets. The protein is useful for treating hypotension, prenal failure, benign prostatic hyperplasia, prostate cancer, and infertility. The activators and inhibitors of potassium channels containing h-erg2 protein, identified using this protein are useful for treating or preventing conditions as described above, where the activity of potassium channels containing h-erg2 protein is absormal. The nucleic acid encoding the human erg2 protein is useful in various diagnostic methods, and a DNA or RNA oligonucleotide probe is useful in diagnostic methods, and a DNA or RNA oligonucleotide probe is useful in diagnostic methods, and a DNA or RNA eligonatiant forms of h-erg2 gene, to determine the level of patients having variant forms of h-erg2 gene, to determine the level of expression of RNA encoding h-erg2, or to isolate genes homologous to hergal protein into cells of the target techniques to introduce the h-erg2 protein into cells of the target techniques to introduce the h-erg2 protein into cells of the target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           organs. The present sequence represents a PCR primer specific for the human erg2 cDNA of the invention. This primer can be used to amplify a region of h-erg2 DNA for use as an oligonucleotide probe in Northern blot

S

밁

The present invention describes an RNA (I) used for the interference or inhibition of expression of a target gene, where (I) comprises double stranded RNA of 15-40 nucleotides in length and a 3' or 5' overhang having a length of 0-nucleotide to 5-nucleotides on each strand, where the sequence of the double stranded RNA is substantially identical to a portion of a mRNA or transcript of the target gene. Also described: (I) interfering with or inhibiting the expression of a target gene in a cell by exposing the cell to an amount of (I); (2) a gene silencing array comprising a substantially flat substrate, and addressably arrayed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a Bacillus thuringiensis isolate (I) active against nematodes, selected from strains PS167P, PS158D5, PS169E, PS177FI, PS177G, PS204G4, and PS204G6. (I) comprises a toxin encoded by (II). Contacting nematodes with (I), where the DNA (II) has been transformed into a plant or other host cell, may be used to control nematodes. In addition, administering a toxin, from a wild-type Bacillus thuringiensis DNA, to a host harbouring a fluke, or directly to a fluke may also be useful for controlling flukes. The present sequence represents the probe 33F2B used to detect nucleic acid encoding B. thuringiensis gene PS33F2 which encodes a nematode-active delta-
                                                                                                                                                                                                                                                                                                                                                                  New RNA comprising double stranded RNA and a 3' (
length of 0-nucleotide to 5-nucleotides on each (

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       different double-stranded RNAs; (3) an array-based method of assessing a phenotypic effect of a double-stranded RNA on a target gene; (4) validating a gene as a potential drug target for a disease or condition; (5) selecting an optimised sequence of a double-stranded RNA for interference with or inhibition of expression of a target gene in a cell; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene comprising any of 311 20-78 nucleotide sequences (see ADC16276 to ADC16586). (1) has cytostatic activity, and can be used in gene therapy. The RNAs are useful as reverse genetic and/or therapeutic tools for interfering or inhibiting expression

The invention relates to short interfering nucleic acids (siNA) which compression of the human Myc or Myb genes by RNA contractive. The siNAs may not comprise ribonucleotides and may composed by couble or single stranded. They further comprise sense and antisense contractively are assembled from a sense oligonucleotide and internatively are assembled from a sense oligonucleotide and contractively are assembled from a sense oligonucleotide and internatively are assembled from a sense oligonucleotide and contain graph (sirkna), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be chemically synthesised, concar contain deoxyribonucleotides, and can be chemically synthesised. The invention also crelates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are cused to modulate expression of the Myc or Myb genes in cells, tissue condition complexes for the treatment of a variety of conditions. They may be considered for treating cancers and other proliferative diseases, such as crestenosis and polycystic kidney disease. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and condition, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents a chemically modified siRNA targeted to the human Myc mRNA transcript.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of Myc or Myb genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 7; Page 130; 161pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Мсвwiggen J,

29-AUG-2002;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. As a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the Myc or Myb genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancers and other proliferative disease, such as restenosis and polycystic kidney disease. The siNas are also useful for drift of the conditions of the sinas are also useful for the sinas are also useful f

The invention relates to short interfering nucleic acids (siNA) which compregulate expression of the human Myc or Myb genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense cregions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, compressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the Myc or Myb genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancers and other proliferative diseases, such as restenosis and polycystic kidney disease. The siNAs are also useful for calidation and cancer and conterpendics. Studying gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; cytostatic; vasotropic; nephrotropic; DNA-RNA hybrid; ss.
                                validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms) The present sequence represents a chemically modified siRNA targeted the human Myc mRNA transcript.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of Myc or Myb genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           09-SEP-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                               (6iNA) molecule that down-regulates expression of an endogenous mammalian target gene comprising one or more chemical modifications and each strand of the double-stranded siNA comprises about 21 nucleotides. The siNA of the invention demonstrates antiarteriosclerotic, neuroprotective, nootropic, antiparkinsonian and anticonvulsant activities and may be useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition that responds to modulation of gene expression or activity in a cell, tissue or organism. The disease or condition may include pulmonary diseases such as restenosis, atherosclerosis, Alzheimer's disease, pallepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA DNA-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New double-stranded short interfering nucleic acid molecule, useful for down-regulating the expression of an endogenous mammalian target gene of the treating diseases that respond to modulation of gene expression or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mcswiggen J, Beig

                                                                                                                                                                                                                                                                                           The invention relates to a novel method of mutation analysis of a target nucleic acid which comprises incubating a sample having the target nucleic acid in a reaction mixture, in the presence of at least one first and second nucleic acid, where incubation produces amplified products, generating duplexes in the amplified products and detecting the presence or absence of a heteroduplex from the duplexes, where its presence indicates a potential mutation in the target nucleic acid and its absence indicates the absence of mutation in the target nucleic acid. The method and compositions of the invention way be useful for analysing mutation and diagnosing patients affected with PKD (polycystic kidney disease). The current sequence is that of a PCR primer of the invention which was used to amplify human polycystic kidney disease PKD-2 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analyzing mutations of a target
from generated duplexes, useful
polycystic kidney disease.
